The general form of wavefunction for a system of particles, each with position r_i and z-component of spin s_z is $\int \psi(r_i, s_z) \delta(r_i - r) \delta(s_z - s) dr ds$, integrals over continuous positions r .. for clarity and brevity, the coordinates are collected into tuples, the indices label the particles (which cannot be done physically, but is mathematically necessary). These operators will "operate" on a wave function, ψ , which is assumed to exist, and which is assumed to contain all that is knowable about the quantum mechanical system. we would then solve the resulting equation to get the particulars. and so, in this example, we can write the substitutions into the classical expression for total energy. The following were written mainly to answer questions that came up on phys-l, the forum for physics educators. there is also a secure version of this page.. spreadsheets for solving laplace's equation table for students.
